

IN THE CLAIMS:

*Please amend the claims as follows:*

1. (currently amended) A method for image processing at an image processing system, in which the number of bits is fixed in an encoded bit string, wherein a pixel is encoded into the bit string, the method comprising:

- ~~at the start of a line when~~ if a prediction value is not available for the pixel,<sub>1</sub>;  
encoding a quantized pixel value to the bit string,
- if the prediction value is available for the pixel,
  - determining a difference between the pixel value and the prediction value, which difference is used for selecting a method for encoding among more than two encoding methods to encode said pixel into the bit string, each method for encoding having a certain step size for quantizing ~~the~~ a value, and said certain step size being different in each method for encoding, wherein the method further comprising;  
determining a code word indicating the selected encoding method on the basis of the original and limited number of bits in the pixel in such a way that the code word length does not exceed  $N - (M - 1)$  where M corresponds to the limited number of bits and N corresponds to the original number of bits;
  - encoding ~~a~~ said code word indicating the selected encoding method and the quantizer step size<sub>1</sub> and the quantized value to the bit string,
  - in which method the bit string has a fixed-length smaller than the length of the originally digitized pixel for each encoded pixels in the image.

2. (original) The method according to claim 1, wherein the code word to indicate the selected encoding method is of variable length.

3. (previously presented) The method according to claim 1, wherein quantizing is used to encode the bit string, wherein first a limit value is determined, wherein said difference is compared with said limit value in such a way that when the difference is smaller, the quantized value is determined by quantizing the difference, whereas when the

difference is greater, the quantized value is determined by quantizing the original digitized value of the pixel.

4. (CANCELLED)

5. (currently amended) The method according to claim ~~39~~ 1, wherein said code word is determined on the basis of the original and limited number of bits in the pixel in such a way that the code word length is two bits when the absolute value of the difference is less than 32 , and that the code word length is three bits when the absolute value of the difference is more than 31 and less than 128 , wherein when the absolute value of the difference exceeds 128 , the code word length is selected to be one bit, wherein the encoding method is changed.

6. (previously presented) The method according to claim 1, wherein the encoding method to be used is selected between differential pulse code modulation and pulse code modulation coding in such a way that code word lengths greater than one bit indicate the use of differential pulse code modulation coding, wherein the code word length of one bit indicates the use of pulse code modulation coding.

7. (previously presented) The method according to claim 1, wherein the encoding method to be used is selected between ordinary differential pulse code modulation coding and smart differential pulse code modulation coding in such a way that code word lengths greater than one bit indicate the use of differential pulse code modulation coding, wherein the code word length of one bit indicates the use of smart differential pulse code modulation coding.

8. (original) The method according to claim 1, wherein said prediction value is the value of one encoded pixel value or the average of several encoded pixel values.

9. (CANCELLED).

10. (CANCELLED).

11. (original) The method according to claim 1, wherein the pixel is encoded for transfer between a camera module and an electronic device.

12. (currently amended) An image processing system comprising a device comprising a processor being configured to process an image, wherein the device comprises means for encoding a pixel to an encoded bit string, in which the number of bits is fixed, wherein:

- ~~at start of a line when~~ if a prediction value is not available for the pixel, the means for encoding device is configured to encode a quantized pixel value to the bit string,
- if the prediction value is available, the device is configured to determine a difference between the pixel value and the prediction value, which difference is used for selecting a method for encoding among more than two encoding methods to encode said pixel into the bit string, each method for encoding having a certain step size for quantizing ~~the~~ a value, and said certain step size being different in each method for encoding, and to encode a code word indicating the selected encoding method and the quantizer step size, and the quantized value to the bit string, in which device the bit string has fixed-length smaller than the length of the originally digitized pixel for each encoded pixel in the image.

13. (CANCELLED).

14. (previously presented) The system according to claim 12, wherein the system is also configured to determine a limit value, wherein the system is also arranged to compare said difference with said limit value in such a way that when the difference is smaller, the system is arranged to determine the quantized value by quantizing the difference, whereas when the difference is greater, the system is arranged to determine the quantized value by quantizing the original digitized value of the pixel.

15. (CANCELLED)

16. (currently amended) The system according to claim-40 12, wherein the system is also configured for forming the length of the code word on the basis of the original and limited number of bits in the pixel in such a way that the code word length is two bits when the absolute value of the difference is less than 32 , and that the code word length is three bits when the absolute value of the difference is more than 31 and less than 128 , wherein when the absolute value of the difference exceeds 128 , the code word length is one bit, to change the encoding method.

17. (previously presented) The system according to claim 12, wherein the system also comprises a differential pulse code modulation codec and a pulse code modulation codec, wherein code word lengths greater than one bit indicate the use of the differential pulse code modulation codec, wherein the code word length of one bit indicates the use of the pulse code modulation codec.

18. (previously presented) The system according to claim 12, wherein the system also comprises an ordinary differential pulse code modulation codec and a smart differential pulse code modulation codec, wherein code word lengths greater than one bit indicate the use of the differential pulse code modulation codec, wherein the code word length of one bit indicates the use of the smart differential pulse code modulation codec.

19. (original) The system according to claim 12, wherein said prediction value is the value of one encoded pixel value or the average of several encoded pixel values.

20. (original) The system according to claim 12, wherein the system also comprises means for decoding the bit string to correspond to the encoding.

21. (original) The system according to claim 12, wherein the system also comprises a camera module and an electronic device.

22. (original) The system according to claim 21, wherein the electronic device comprises means for performing mobile communication.

23. (currently amended) A device for image processing, which device comprises a processor ~~is~~ configured to process an image, wherein the device comprises means for encoding a pixel to an encoded bit string, in which the number of bits is fixed, wherein:

- ~~at the start of a line when if~~ a prediction value is not available for the pixel;  
the means for encoding ~~device~~ is configured to encode a quantized pixel value to the bit string
- if the prediction value is available, the ~~device~~ means for encoding is configured  
to determine the difference between the pixel value and the prediction value, which difference is used for selecting a method for encoding among more than two encoding methods to encode said pixel into the bit string, each method for encoding having a certain step size for quantizing ~~the~~ a value, and said certain step size being different in each method for encoding, and  
to encode ~~a~~ said code word indicating the selected encoding method and the quantizer step size, and the quantized value to the bit string,  
in which device the bit string has fixed-length smaller than the length of the originally digitized pixel for each encoded pixel in the image.

24. (CANCELLED).

25. (previously presented) The device according to claim 23, wherein the device is also configured for determining a limit value, wherein the device is also arranged to compare said difference with said limit value in such a way that when the difference is smaller, the device is arranged to determine a quantized value by quantizing the difference,

whereas when the difference is greater, the device is arranged to determine the quantized value by quantizing the original digitized value of the pixel.

26. (previously presented) The device according to claim 23, wherein the device comprises also a decoder for decoding the bit string in the way indicated by the code word.

27. (CANCELLED).

28. (previously presented) The device according to claim 27, wherein the device also comprises a transceiver for performing mobile communication.

29. (previously presented) The device according to claim 23, wherein the device also comprises a transceiver for performing mobile communication

30. (previously presented) A readable storage for storing software instructions for image processing with a limited number of bits in an encoded bit string of a pixel, as well as for encoding the pixel to the limited number of bits where said software instructions are executed by a processor to carry out the method of claim 1.

31. (previously presented) A camera module comprising the device of claim 23.

32. (currently amended) A circuit for image processing, which circuit comprises an encoder and a decoder, which encoder comprises encoding means is configured to encode a pixel to an encoded bit string, in which the number of bits is fixed, wherein:

- ~~at start of a line when if~~ a prediction value is not available for the pixel, the ~~encoder~~ encoding means is configured to encode a quantized pixel value to the bit string,

- if the prediction value is available, the ~~encoder~~encoding means is configured to determine a difference between the pixel value and the prediction value, which difference is used for selecting a method for encoding among more than two encoding methods to encode said pixel into the bit string, each method for encoding having a certain step size for quantizing ~~the~~a value, and said certain step size being different in each method for encoding, ~~and~~ to encode ~~a~~said code word indicating the selected encoding method and quantizer step size, and the quantizer value to the bit string, in which the circuit the bit string has fixed-length smaller than the length of the originally digitized pixel for each encoded pixel in the image.

33. (CANCELLED).

34. (previously presented) The circuit according to claim 32, wherein the encoding method to be used is differential pulse code modulation or pulse code modulation coding.

35. (previously presented) The circuit according to claim 32, wherein the encoding method to be used is ordinary differential pulse code modulation coding or smart differential pulse code modulation coding.

36. (original) The circuit according to claim 32, wherein the decoder is arranged to decode the bit string by a decoding method corresponding to the encoding method used.

37. (currently amended) A device for image processing, comprising:

a decoder for decoding an encoded bit string to obtain pixels of an image, in which bit string the number of bits is fixed,

wherein the bit string comprises a code word and a value, wherein the decoder ~~is~~comprises decoding means configured

to recognize the code word to select a decoding method indicated by the code word among at least a first decoding method and a second decoding method corresponding with the encoding method used in forming the bit string;

to determine a dequantizer value on the bases of the selected decoding method, wherein the decoder comprises a memory for storing at least one decoded pixel as a prediction value, wherein the device is arranged to retrieve the prediction value corresponding to the pixel from said memory,

wherein said code word has been determined on the basis of the original and the limited number of bits in the pixel in such a way that the code word length does not exceed  $N - (M - 1)$  where M corresponds to the limited number of bits and N corresponds to the original number of bits,

wherein said device is configured to dequantize said value by said dequantizer value to obtain a dequantized value, and

if the first decoding method was selected, the device is configured to use said dequantized value to obtain the pixel value,

if the second decoding method was selected, the device is configured to use said dequantized value and said prediction value to obtain the pixel value, in which device the bit string has fixed-length smaller than the length of the obtained pixel value for each pixel in the image.

38. (currently amended) A device for image processing, which device comprises a processor is configured to process an image, wherein the device comprises encoding means for encoding a pixel to an encoded bit string, in which the number of bits is fixed, wherein

~~at the start of a line when~~ if a prediction value is not available for the pixel:

~~the device~~ encoding means is configured to encode a quantized pixel value to the bit string, if the prediction value is available, ~~the device comprises~~ wherein the encoding means is configured

- ~~means for determining~~ to determine the difference between the pixel value and the prediction value, which difference is used for selecting a method for encoding among more than two encoding methods to encode said pixel into

the bit string, each method for encoding having a certain step size for quantizing ~~the~~a value, and said certain step size being different in each method for encoding, and

~~means for encoding~~ to encode the code word indicating the selected encoding method and the quantizer step size, and the quantized value to the bit string;

- in which device the bit string has fixed-length smaller than the length of the originally digitized pixel for each encoded pixel in the image.

39. (CANCELLED)

40. (CANCELLED)
